                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5341-5341 1988). The fragment obtd. was amplified by Bek4A (AAO23619) and Bek1B (AAO23620) primers, and the obtd. full length bek clone was subs- equently sequenced and the protein sequence deduced. Receptor proteins encoded by this cDNA sequence may be used in pharmaceutical compans. to inhibit undesirable heparin-binding growth factor mediated cellular responses or to inhibit the binding of an opportunistic pathogen to human cells. Such undesirable responses may be growth factor stimulated angiogenesis and vascularisation of tumours, mitogenic effects in psoriasis, arthritis, atherosclerosis and benign prostatic hypertrophy. The derived bek protein may also be used for screening drugs. See also AAO21003,4 and AAO23610-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The oligonucleotide 3'mbek was used screen a one day old human brain stem library as it is complementary to the 3' end of the partial murine bek coding sequence (Kornbluth et al., Mol. Cell Biol. 8: 5541-5544 1988). The fragment obtd. was amplified by Bek4A (AAQ23619) and Bek1B (AAQ23620) primers, and the obtd. full length bek clone was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cornea; proliferation; in vivo; hepatocyte growth factor; injury; PCR; keratinocyte growth factor; ocular surgery; epithelium; endothelium; expression; receptor; polymerase chain reaction; amplification; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAT63287 standard;
                                  The invention relates to methods for promoting corneal cell proliferation in vivo by treating the cells with hepatocyte growth factor (HGF) and optionally keratinocyte growth factor (KGF). Methods for suppressing corneal cell growth include administering Ca ions to the
                                                                                                                                                                                                                                                                           Promoting or suppressing corneal cell proliferation - hepatocyte growth factor or calcium lons resp., e.g. i corneal injury or for preserving corneal tissue prior

                                                                           following accidental injury, ocular surgery or due to corneal disorders caused by abnormal healing processes of the corneal epithelium and endothelium. The methods are based on the discovery that corneal tissue can express mRNA for HGF, KGF and their respective receptors. The discovery was shown by PGR amplification using the primers AAT63273-87. This probe is used to detect the 205 bp fragment amplified from the fibroblast growth factor (FGF) receptor 2 cDNA by primers AAT63283 and AAT63286. The probe corresponds to nucleotides 30-59 of the FGF receptor
                                                      gene.

The present sequence was used in the development of a novel method for the inhibition of corneal epithelial cell differentiation. The method comprises contacting the cells with a hepatocyte growth factor (HGF) and/or keratinocyte growth factor (KGF). When HGF and KGF are both used, the cells can be contacted with them sequentially or simultaneously. The HGF and/or KGF is in a timed release delivery system, especially comprising biodegradable polymer microcapsules. The HGF and/or KGF are administered topically. The method is used for treating dry eye, especially Sequence keratoconjunctivitis sicca. 30 BP; 11 A; 7 C; 4 G; 8 T; 0 other;

The present invention relates to oligonucleotides encoding polymorphic CC variants of proteins related to amylases, amyloid proteins, angiopoietin, CC apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, CC histones, kinases, colony stimulating factors, complement related CC proteins, cytochromes, kinesins, cytokines, interferons, interleukins, CC G-protein coupled receptors and thioesterases. The present sequence is CC one such oligonucleotide, The oligonucleotides and the peptides encoded CC by them may be used in the prevention, diagnosis and treatment of CC diseases associated with inappropriate expression of the proteins listed CC above. Disorders that may be prevented, diagnosed and/or treated include CC multifactorial diseases with a genetic component, such as autoimmune CC diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, CC systemic lupus erythromatosus and Grave's disease, inflammation, cancer CC (e.g. cancers of the bladder, brain, breast, colon and kidney, leukamentania), diseases of the nervous system and an infection of pathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 4

The invention relates to producing a sub-population of labeled nucleic acids (NAs) comprising contacting a NA sample from a physiological councies, with a pool of 50 distinct gene specific primers under sultable conditions to enzymatically generate sub-population of NAS, where canh gene specific primer has a sequence complementary to a distinct man, and each labeled NA is generated using a single gene specific CC primer. The method is useful for producing a sub-population of labeled CC NAS which is useful for analysing the differences in the RNA profiles between several different physiological sources, where the method CC comprises producing subpopulation of labeled NAs for the different CC physiological sources, comprising the populations for each physiological sources to identify differences in the populations for each physiological cource to identify differences in the population, where the comparison CC is preferably performed by hybridising the labeled NAS for the Comparison CC distinct physiological sources to an array of probe NAS stably associated with the surface of a substrate to produce a hybridisation CC the sources, where differential gene expression assays are cutilised in differential expression analysis of diseased a normal CC subtissue types. The present sequence is a human gene specific PCR CC Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic for the printed specification, but was obtained in electronic

The invention relates to producing a sub-population of labeled nucleic conditions (NAs) comprising contacting a NA sample from a physiological countries, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAs, where ceach gene specific primer has a sequence complementary to a distinct companier. The method is useful for producing a single gene specific primer has a sequence complementary to a distinct companier. The method is useful for producing a single gene specific comprises producing subspopulation of labeled NAs for the RNA profiles between several different physiological sources in the method comprises producing subspopulation of labeled NAS for the different physiological sources, where the method comprises producing subspopulation of labeled NAS for each of the sources in the population, where the comparison is preferably performed by hybridising the labeled NAS for each of the sources to an array of probe NAS stably associated with the surface of a substrate to produce a hybridisation pattern for each of the sources, and comparing the patterns for each of the sources, and comparing the patterns for each of the sources, where tissue, or different tissue or subtissue types. The present sequence is a human gene specific PCR of the printed specification, but was obtained in electronic format directly from USPTO at the process hemispecific process.
                                                                                                                                                                                                                                                                                                             AAX84630

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents an oligonucleotide used to test a DNA CC obstruction assay for assessing interaction between receptors and CC ligands. The invention relates to a method for the characterisation of CC biological samples, and comprises detecting the binding of individual CC members of a library of molecular probes to molecular components in the CC sample. The method comprises: (a) contacting the sample with a library of molecular probes to bind to their specific binding CC partners; and (b) detecting any binding of individual members of the CC library of molecular probes to molecular components in the sample using a CC library with the sample provides a molecular component in the sample using a library with the sample provides a molecular fingerprint of the sample. CC molecular components such as proteins, glycoproteins, polynucleotides, CC molecular components such as proteins, glycoproteins, polynucleotides, CC can be used for diagnosing a disease or condition in a patient and for CC used for conditions such as diabetes, infectious disease, heart disease, neoplastic disorders, autoimmune disease and cc central nervous system disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The oligonucleotide 3'mbek (AAQ23618)was used screen a one day old human train stem library as it is complementary to the 3' end of the partial murine bek coding sequence (Kornbluth et al., Mol. Cell Biol. 8: 5541-5544 1988). The fragment obtd. was amplified by Bek4A and Cequently sequenced and the obtd. full length bek clone was subscenceded by this cDNA sequence may be used in pharmaceutical compans: to inhibit undesirable heparin-binding growth factor mediated cellular responses or to inhibit the binding of an opportunistic pathogen to CC human cells. Such undesirable responses may be growth factor stimulated angiogenesis and vascularisation of tumours, mitogenic effects in CC psoriasis, arthritis, atherosclerosis and benign prostatic hypertrophy. CC See also AAQ21003,4 and AAQ23610-7.

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoletin, comportosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related components, cytochromes, kinesins, cytokines, interferons, interleukins, components, cytochromes, interferons, interleukins, components, coupled receptors and thloesterases. The present sequence is component of the protein coupled receptors and thoesterases. The present sequence is component by them may be used in the prevention, diagnosis and treatment of components associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include cultifactorial diseases with a genetic component, such as autoimmune concers of the bladder, brain, breast, colon and kidney, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, colonarisms), diseases of the nervous system and an infection of pathogenic corpanisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Š

                                                                            The invention relates to the identification of nucleic acid molecules (AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity

ARASHUT 12
ARASH 316
ID ARASH
AC ARASH This invention describes a novel method of determining a predisposition to disease by genotyping a subject's DNA sequence (A) of the human CC mismatch repair gene, MSH6 at specified positions and comparing with CC reference DNA sequences, optionally taking into account all possible CC combinations of variations of the individual mutations, including any CC chosen absolute number of variations. (A), and analysis of their CC sequences, are useful for the following: (1) determining a predisposition CC to disease, especially colorectal, endometrial and ovarian carcinoma and CC leukemia; (ii) determining an increased mutation rate (frequency of base substitutions, insertions and/or deletions) in eukaryotic cells; (ii) CC predicting the progression, severity and survival time of patients with CC chemotherapeutic agents (e.g. cis-platin) or drugs developed from (iv): CC chemotherapeutic agents (e.g. cis-platin) or drugs developed from (iv): C coplasia; (vi) controlling the mutation rate in eukaryotic cells, in vitro or in vivo; (viii) constructing genes and vectors, particularly for

support for the immobilisation of nucleotide sequences. The support molecule is a dial linked to a controlled pore glass particle (CPGP), by a phosphodiester bond. Oligonucleotides can then be linked to the dial, nucleotide segment can then be linked to the dial, nucleotide segment can then be linked to the dial. A protected by tandem ligation. This method can also be used as a continuous source universal primers and diagnostic probes. The immobilised sequences can be used for e.g. gene detection, diagnostic assays, priming of enzymatic
                                                                                                                       The sequences represented by AAT05795 and AAT05796 are oligonucleotides used in the method of the invention. The invention provides a new soli

This invention describes a novel method for obtaining a set of CC biallelic markers represented in AAX52533-X52632 and AAX52833-X52843 for CC use in constructing a high density equilibrium map of the human genome. CC The method involves (a) obtaining a nucleic acid library comprising CC genomic DNA fragments comprising the full genome or a portion CC (b) determining the order of genomic DNA fragments in the genome. CC (c) determining the sequence of selected regions of the genomic DNA CC fragments and (d) identifying nucleotides in the genomic DNA fragments and (d) identifying nucleotides in the genomic DNA fragments of biallelic CC markers. The methods can be used for identifying traits such as disease CC (e.g. Alzheimer's disease, drug response, drug efficacy and drug contictly. They can be used for selecting an individual for inclusion in CC a clinical trial. The method is used to map the position of genes in a CC genome (preferably the human genome). The sequences described in the method CC of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 14

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA synthesis, isolation and purification of DNA binding proteins. The advantage with this method is that the sequences can be deprotected simply by using a solution of NaOH, whereby the oligonucleotides remain attached to the solid phase and the integrity of the nucleotide strand is unaffected. This method is also faster and more efficient than
                                                                                                                                                                                                                                                                                                                                                                                                                    (GEST ) GENSET

ANX69579 to ANX77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density invention have a variety of uses: they can be used for high density impping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the effects from pharmaceutical agents acting on a disease as well as other treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human genome; biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; diagnosis; single nucleotide polymorphism; SNP; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cohen D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21-APR-1998;

                                                                                                                 The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical cagent to be tested for anti-neoplastic activity, determining a change in cagent to be tested for anti-neoplastic activity, determining a change in comprises a sequence (S) selected from 8447 sequences (given in ABL6164 cc to ABL70110), or is at least 95% identical to (S), where a change in capression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening can anti-neoplastic agent, and can be used for producting a product which is the data collected with respect to the anti-neoplastic agent as a cresult of M1, and the data is sufficient to convey the chemical consulture and/or properties of the agent. M1 can be used in the creatment of cancer such as colon, breast, stomach, lung, thyroid, cossophageal, ovarian, kidney, prostate or pancreatic cancer, infiltrating ductal cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and wilm's tumour.
